PORTALDOT HACKER HOUSE 2026 · MODULAR CLOUD & MIDDLEWARE

THE DOCS SAY `transfer`. V3 HAS NEVER HEARD OF IT.

Plumbline checks each call Portaldot documents against the runtime's own metadata, and proves calls with real transactions read back from their blocks.

DOCS → V3 · SPEC 3002

BOOKED 2026-10-19 UTC

STA.	CALL, AS DOCUMENTED	ON V3	RECEIPT
1	BALANCES ~~transfer~~ *V3 has transfer_allow_death, transfer_keep_alive ↓*	**ABSENT**	no such call
2	BALANCES transfer_all	**UNPROVEN**	present · no tx
3	BALANCES transfer_keep_alive	**PROVEN** ✓	106425-1
4	ELECTIONPROVIDERMULTIPHASE ~~governance_fallback~~ *docs: 2 args · V3: none*	**ARG_DRIFT**	2 args → 0
5	SYSTEM remark_with_event	**PROVEN** ✓	106424-1
6	UTILITY batch_all	**PROVEN** ✓	106426-1

```
$ plumbline check examples/mainnet-dapp --target v3   # evidence/check_v3.txt
summary: 9 findings in 9 files scanned · ARGS-UNCHECKED 2, UNPROVEN 5, COMPAT-UNMEASURED 1, UNSCANNED 1 · blocking 0 · exit 0
```

DOCS AND CHAIN DISAGREE

A builder copies `Balances.transfer` from the Portaldot docs. On the V3 testnet that call does not exist, and the page does not say which runtime it describes.

	WHAT THE SOURCES SAID	WHAT V3 REPORTS
ENDPOINT	~~`testnetv3-node.feso-apps.xyz`~~ *V3 testnet guide §1.1 · no DNS on 2026-10-14*	`test-node-v3.portaldot.dev`
SPEC	~~`portaldotV3 / 3000`~~ *a third-party README, not re-verified*	`portaldot-v3 / 3002`
SYMBOL	~~`tPOTv3`~~ *V3 testnet guide §1.1, §3.1*	`tPOT`
PALLETS	~~70~~ *the same README, not re-verified*	69

79 → 2

Of the **196** calls in Portaldot's mainnet docs, **79** disagree with mainnet spec 1002 (64 absent or renamed, 15 with other arguments). **2** disagree with V3 spec 3002: `Balances.transfer` and `governance_fallback`. The pages name no spec.

CALL, VERDICT, PROOF

Sta. 01

DOCUMENTED CALL

22 mainnet docs pages give 196 calls. The V3 testnet guide at `d671a32` gives 46 `compose_call` sites and 12 FAQ modules, read by AST and text, never executed.

`plumbline docs · guide`

→ Sta. 02

VERDICT

Each entry is joined to one runtime's metadata and gets exactly one verdict, stamped with profile, spec version and metadata hash. Same inputs, byte-identical ledger.

`plumbline plumb`

→ Sta. 03

PROOF

A canary extrinsic is signed and sent, its receipt kept, then re-read from its block by hash in a new process. PROVEN needs that receipt.

`plumbline canary · readback`

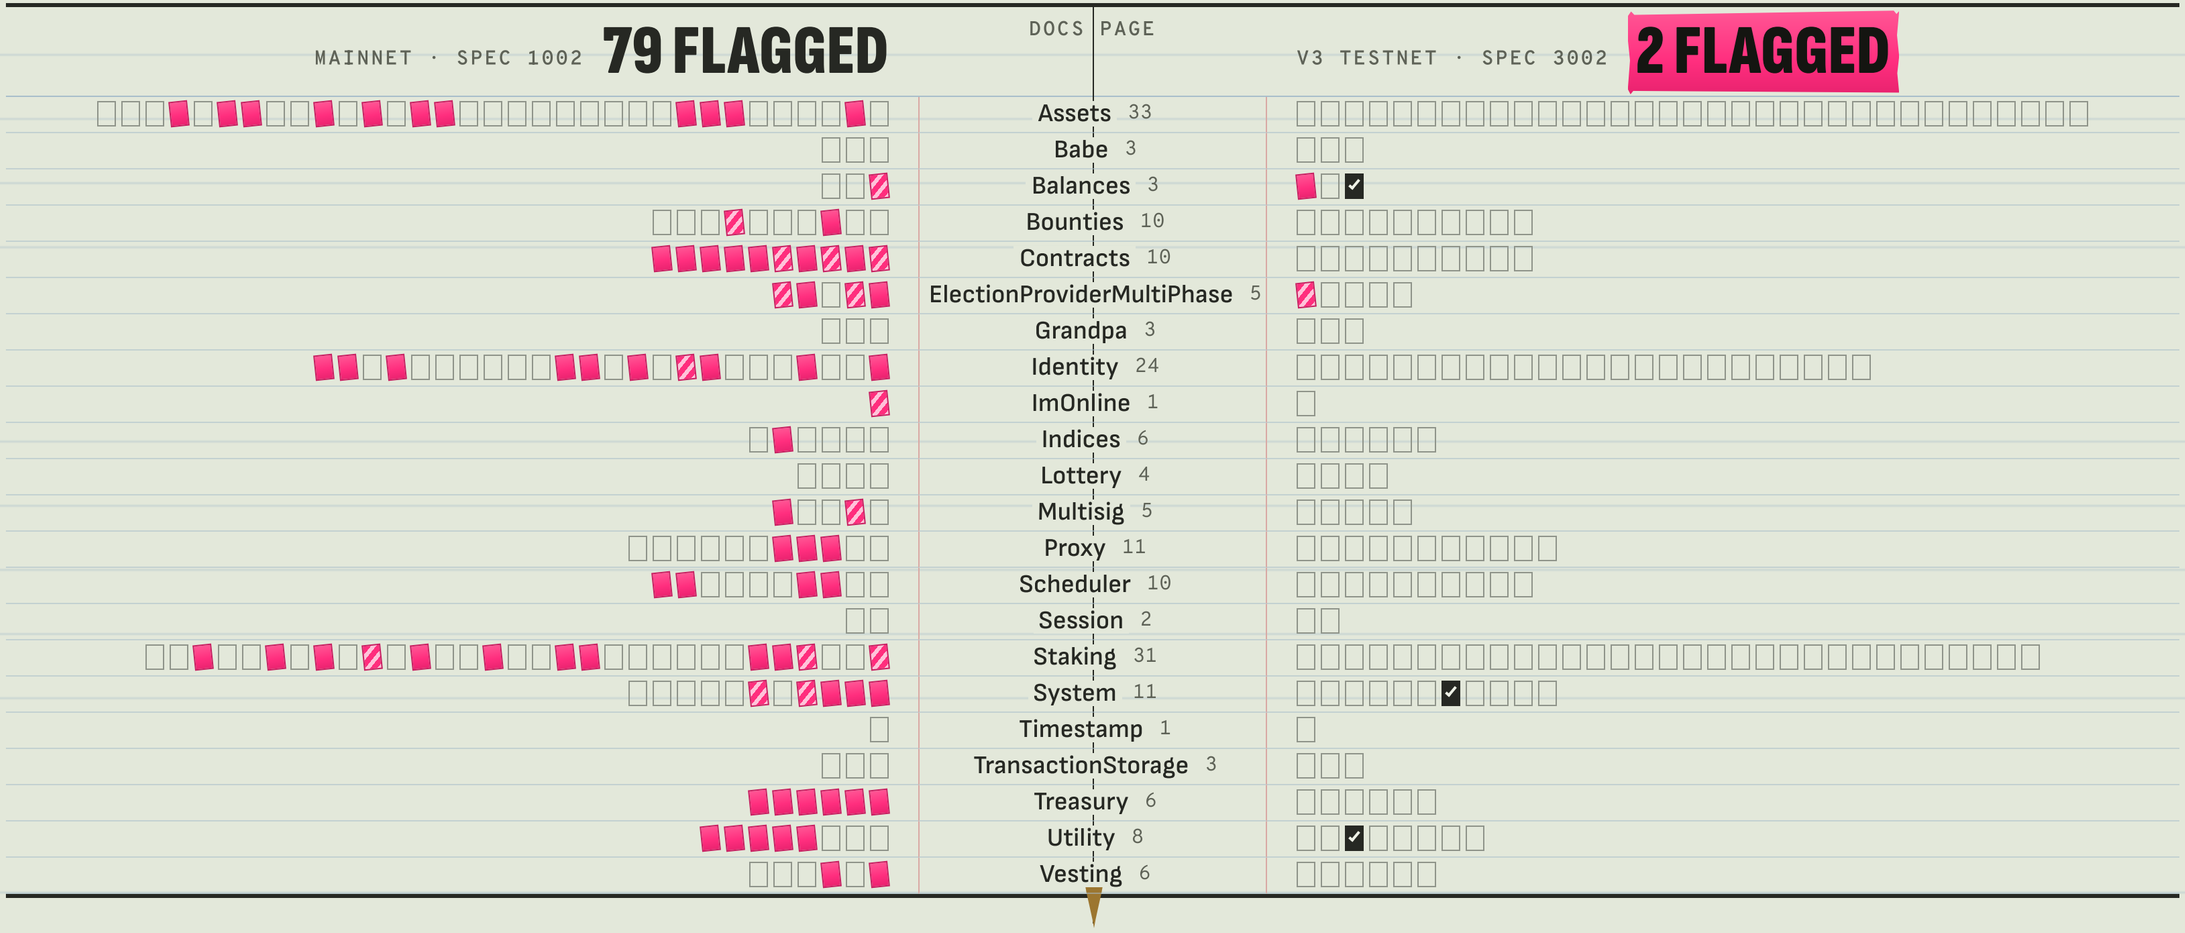

PROVEN | UNPROVEN | ARGS-UNCHECKED | ARG_DRIFT | DRIFTED | ABSENT

verdicts from plumbline/verdicts.py

Beside the flow: `plumbline diff A B` lists what moved between two runtimes; `plumbline check <dApp> --target v3` classifies a dApp's call sites against one runtime and exits 0 / 1 / 2.

SAME 196 CALLS. TWO RUNTIMES.

Every call in Portaldot's mainnet docs, booked by docs page. Left: hung against mainnet spec 1002. Right: the same calls against the V3 testnet, spec 3002, on 2026-10-19.

absent or renamed · other arguments · proven by a transaction · present, no tx yet

3 proven · **191** unproven · **1** arg drift · **1** absent on V3

```

Detail of docs/architecture.png (earlier sheet style): the core flow. The full drawing adds the inputs, check.py, diff.py and the chains.

SOURCES, ENGINE, EVIDENCE

1 DOCUMENTED CALL

`docs.py · guide.py`: three docs page layouts, the guide's call table and AST call sites.

2 VERDICT

`plumb.py` joins each entry to one runtime: 549 rows in `evidence/ledger_v3.json`.

3 PROOF

`canary.py` signs, submits, keeps the receipt and reads it back: 3 / 3 in `docs/PROOF.md`.

The guide is untrusted data: cloned outside the repo, parsed, never run.

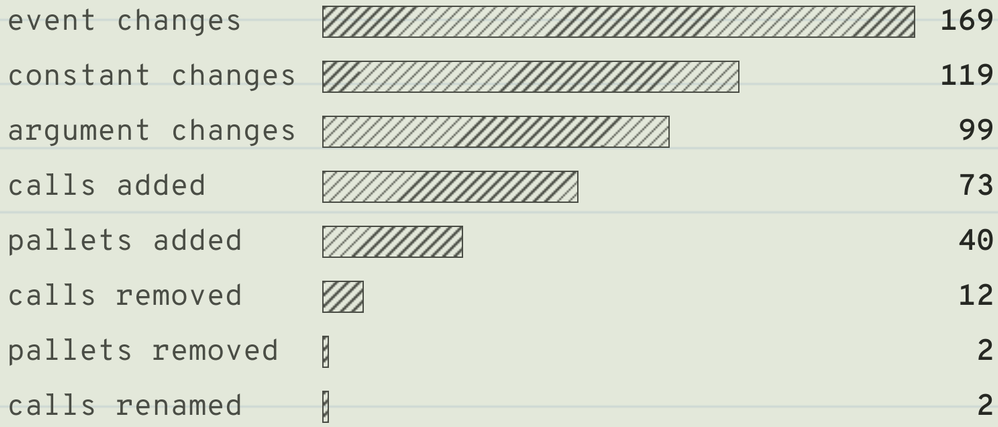

A VERDICT NEEDS A RECEIPT

DOCS PAGES	what was designed; the pages name no runtime spec
NODE-CONSOLE	Portaldot's explorer: what exists at one block, not what the docs promised
METADATA DIFF	what moved between two runtimes, not whether the docs match either one
ONE TEST TX	that one call worked once, on one runtime

Plumbline joins them: each docs entry against the runtime's own metadata, one verdict stamped with the spec, PROVEN only with a receipt, re-run on the next runtime.

WHAT MOVED, MAINNET SPEC 1002 → V3 SPEC 3002

516 rows from `plumbline diff` · evidence/diff_1002_v3.json

5 → 0 blocking findings for the same example dApp under `plumbline check`: on spec 1002, then on V3

BETWEEN PORTALDOT'S DOCS AND ITS RUNTIME

DOCUMENTED
WHAT BUILDERS READ

portaldot-dev.readthedocs.io extrinsic pages, and the third-party V3 testnet guide (d671a32) with its FAQ

PLUMBLINE
THE MIDDLEWARE

PLUMB • DIFF • CHECK • CANARY
through the SDK Portaldot's docs point to, substrate-interface 1.8.1: compose_call · create_signed_extrinsic · submit_extrinsic · get_block · get_events

RUNTIMES
WHAT ACTUALLY RUNS

V3 testnet portaldot-v3 / 3002 · mainnet spec 1002, read-only: state_getMetadata · state_getRuntimeVersion · state_getStorageHash(:code)

PINNED TO THE REAL V3

The v3 profile checks spec name portaldot-v3, genesis 0xd4f9acbc… 5283bd and spec 3002, and fails loudly on a mismatch.

RE-RUN PER UPGRADE

The spec 1002 baseline and the spec 3002 sheet come from the same commands; the next runtime is the next run.

WHO RUNS IT, WHO PAYS

WHO	MOMENT OF PAIN	WHAT THEY GET	STATUS
HACKER HOUSE BUILDERS NOW · THE FIRST AUDIENCE	a documented call fails on V3	`plumbline check <dApp> --target v3`; exit 1 on blocking findings, so it can gate CI	TODAY
TEAMS MOVING 1002 → V3	not knowing what breaks on V3	the 516-row runtime diff, and `check` run on their repo	TODAY
PORTALDOT DOCS & DEVREL TARGET CUSTOMER	re-verifying every page per runtime by hand	the ledger as docs CI: a “verified on spec N” line per reference entry	PLANNED
WALLETS & INTEGRATORS AFTER THE EVENT	an upgrade changes call shapes	a diff and a canary re-run per upgrade; always-on alerts as the paid tier	PLANNED

MODEL

Docs CI as an ecosystem-funded public good, plus paid upgrade alerts for integrators. Portaldot is the first chain; any Substrate chain whose docs trail its runtime has the same gap.

HONEST LIMIT

No revenue and no external users yet. The first two rows work today on the public repo; the last two are the plan.

RE-RUN EVERY NUMBER HERE

549	verdict rows on V3, spec 3002, byte-identical on re-run
3 / 3	V3 transactions read back from their blocks
263	offline tests passed in the stored run (evidence/pytest_checkin.txt, at c484fcb) · 116 commits from 2026-10-14 to build 2460a0d

planned a canary per documented call (3 of 196 PROVEN today)

planned the Plumbline Ledger contract (Revive) on V3

open gap `check` does not detect TYPE-TRAP yet; runtime APIs (ReviveApi) are not checked yet

```
$ pip install -e '.[dev]' && pytest -q
$ plumbline check examples/mainnet-dapp --target v3
# … · blocking 0 · exit 0
```
