Plumbline

Portaldot's documented calls, plumbed against the V3 runtime and proven by real transactions.

One verdict per documented entry on the V3 testnet: 549 verdict rows, and 3 canary transactions read back from their blocks.

BUILT FOR PORTALDOT HACKER HOUSE 2026	MODULAR CLOUD & MIDDLEWARE	v0.0.1

DOCS AND CHAIN DISAGREE

A builder at the Hacker House copies `Balances.transfer` from the Portaldot docs. On the V3 testnet that call does not exist, and the page does not say which runtime it describes.

Today the way to find out is to submit a transaction and read the error. The next runtime upgrade moves the line again.

	WHAT THE SOURCES SAID	WHAT V3 REPORTS
ENDPOINT	~~testnetv3-node.feso-apps.xyz~~ V3 testnet guide §1.1 · no DNS on 2026-10-14	test-node-v3.portaldot.dev
SPEC	~~portaldotV3 / 3000~~ a third-party README	portaldot-v3 / 3002
SYMBOL	~~tPOTv3~~ V3 testnet guide §1.1, §3.1	tPOT
PALLETS	~~70~~ the same third-party README	69

79 of the 196 calls in Portaldot's mainnet docs disagree with mainnet spec 1002 (64 absent, 15 with other arguments).

2 of the same 196 disagree with the V3 runtime, spec 3002.

CALL, VERDICT, PROOF

STA. 01

DOCUMENTED CALL

22 mainnet extrinsic pages give 196 calls. The V3 testnet guide at **d671a32** gives 46 **compose_call** sites and 12 FAQ modules, read by AST and never executed.

```
$ plumbline docs
$ plumbline guide
```

→

STA. 02

VERDICT

Each entry is joined to one runtime's metadata and gets exactly one verdict, stamped with profile, spec version and metadata hash. Same inputs, byte-identical ledger.

```
$ plumbline plumb
```

→

STA. 03

PROOF

A canary extrinsic is signed and sent, its receipt kept, then re-read from its block by hash in a new process. PROVEN needs that receipt.

```
$ plumbline canary
$ plumbline readback
```

PROVEN | UNPROVEN | ARGS-UNCHECKED | ARG_DRIFT | DRIFTED | ABSENT

verdicts from `plumbline/verdicts.py`

Beside the flow: **plumbline diff A B** lists what moved between two runtimes; **plumbline check <dApp> --target v3** classifies a dApp's call sites against one, with exit codes 0 / 1 / 2.

THE V3 SHEET, REDLINED

Mainnet docs and the V3 guide's FAQ, plumbed against **portaldot-v3** / spec 3002 on 2026-10-19.

DOCUMENTED	VERDICT ON V3
~~Balances.transfer~~ *absent on 3002 · live: transfer_keep_alive, transfer_allow_death*	ABSENT
Balances.transfer_keep_alive canary sent to itself, read back from block 106425: MATCH	PROVEN 106425-1

profile v3 — Portaldot V3 testnet: 3/3 receipts match the chain
```

The block is fetched by hash; the extrinsic at the receipt's index must carry the tx hash and decode to the same call. node-console looks blocks up by number or hash (no tx-hash search). A local stand-in run is kept as test input and labelled *interim-sdk, not V3*. Receipts: **evidence/canary_v3.json**, **docs/PROOF.md**.

PORTALDOT'S TWO RUNTIMES

V3 testnet **portaldot-v3**/3002 · mainnet spec 1002, read-only: **state_getMetadata** · **state_getRuntimeVersion** · **state_getStorageHash** (**:code**)

TRACK: MODULAR CLOUD & MIDDLEWARE

Plumbline sits between Portaldot's docs and its runtime; **check** runs a dApp's calls against V3 before anything is sent.

PINNED TO THE REAL V3

The **v3** profile checks genesis **0xd4f9acbc…5283bd**, spec 3002 and the **:code** hash, and fails loudly on a mismatch.

RE-RUN PER UPGRADE

The spec 1002 baseline and the spec 3002 sheet come from the same commands; the next runtime is the next run.

WHO RUNS IT, WHO PAYS

WHO	MOMENT OF PAIN	WHAT THEY GET	STATUS
HACKER HOUSE BUILDERS NOW, THE FIRST AUDIENCE	a documented call fails on V3	`plumbline check <dApp> --target v3`; exit code 1 on blocking findings, so it can gate CI	TODAY
TEAMS WITH MAINNET CODE MOVING 1002 → V3	not knowing what breaks on V3	the 516-row runtime diff, and `check` run on their repo	TODAY
PORTALDOT DOCS & DEVREL CUSTOMER #1	re-verifying every page per runtime by hand	the ledger as docs CI: a "verified on spec N" line per reference entry	PLANNED
WALLETS & INTEGRATORS AFTER THE EVENT	an upgrade changes call shapes	a diff and a canary re-run per upgrade; always-on alerts as the paid tier	PLANNED

MODEL

Docs CI as an ecosystem-funded public good, plus paid upgrade alerts for integrators. Portaldot is the first chain; any Substrate chain whose docs trail its runtime has the same gap.

HONEST LIMIT

No revenue and no external users yet. The first two rows work today on the public repo; the last two are the plan.

RE-RUN EVERY NUMBER HERE

AT THE CHECK-IN

- **runtime**, **plumb**, **diff**, **check**, **canary** run against V3, spec 3002
- 549 verdict rows, byte-identical on re-run
- 3 V3 transactions, read back 3/3
- 263 tests passed (2026-10-20) · 86 commits from 2026-10-14

PLANNED BEFORE THE FINAL (NOV 6)

- a canary per documented call: 3 of 196 PROVEN today
- Plumbline Ledger contract (Revive) on V3
- **check**: TYPE-TRAP detection, runtime APIs (ReviveApi)
- GitHub Pages docs

```
$ pip install -e '.[dev]' && pytest -q
$ plumbline check examples/mainnet-dapp --target v3   # blocking 0
```
